                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1006103 column:
pBlueScript backbone); Site_1: BamHI: Site_2: BqIII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BgIII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwp42 (gil4732.14) gbjRf129072.1), a copy-number inducible derivative of plasmid RI. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli xL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ATTCATTCATTCATTCATTCAGTGAGGGTTCCCTAAGT 4
                                                                             When T-antigen binding site II is replaced with other DNA, transcription in a cell-free extract takes place at wild-type efficiency, but cannot be repressed by purified T-antigen under conditions that fully repress wild-type transcription. [1] also reports a segment of wild type DNA, which is in the SV40 entry.
                                                                                                                                                                                              83180420
